Susan,

Please go ahead with the installation of the shallow well at this location.

thanks

**Subject:** Cabo Rojo Well MW-3 shallow bedrock

All,

We have made very good progress this week with bedrock well MW-3R at Extasy Q Prints. It encountered water at about 45 feet bgs but we did not hit competent bedrock to set the casing until 92 feet bgs. There was a very productive zone from 47-57 feet bgs. CDM Smith would like to suggest that we install one additional shallow bedrock well as a single screen well to monitor this zone from 47-57 feet. This zone has been cased off in the current well. We feel this shallow well is very important at this location because we know from the soil sample results that Extasy Q Prints has the most contamination of all the PSAs evaluated. This PSA is also only about one block away from the contaminated Ana Maria public supply well. I believe that we will have enough hours and dollars to put in this single screen shallow well within the current PLOE budget (with the additional 616 hours discussed last week) and the current dollars.

Let me know if you want to discuss this proposal, although connecting phones today will be a challenge since our office is closed for a Puerto Rican holiday and CDM Smith staff are working remotely.

Best,

Susan
